Recommendation letter

Tadej worked at Jožef Stefan Institute – Department of Intelligent Systems, while finishing his Masters degree Computer Science study. He worked as a developer on various jobs. Among other systems he implemented a Raspberry PI based bulk SMS hub as a cost efficient alternative for mass SMS deployment which was used as the main communication hub for the IN LIFE project. The goal of the project was to prolong independent living for the elderly by supplying the them with smart wristwatches. Tadej was the main developer on a Codeigniter PHP framework portal for geo tracking, scheduling, and monitoring the elderly via smartwatch-server communication.

He was an active team member always capable of following the instructions. He also demonstrated the abilities to suggest original solutions, communicate his ideas clearly and persuade others to apply them. He did not hesitate to ask for advice when necessary. He had good attitude towards his work colleagues and clients and was therefore appreciated by all.

Based on almost a year of positive experience in working with him I highly recommend him as technically skilled, hard-working developer with excellent attitude to others and the assigned work.

Head of the department:
prof. dr. Matjaž Gams
